

TRYV Tokenomics

Version 1.0 | Production-reconciled public framework

TRYV is designed and intended to function as a utility token within the Taryven ecosystem. Its economic framework uses a fixed maximum supply, defined allocations, staged distribution, long-term contributor vesting, utility-driven rewards, multisignature Treasury controls, and controlled circulation.

Token allocations do not automatically represent circulating supply. TRYV enters circulation only when applicable purchase, vesting, reward, distribution, Treasury, ecosystem, or other authorized release conditions are satisfied.

Publication date: September 24, 2026

CORE SUPPLY POLICY

1,000,000,000 TRYV maximum.

TRYV has an absolute maximum supply of 1,000,000,000 tokens. No additional TRYV may be created beyond that maximum.

Exhaustion of a rewards, referral, Treasury, ecosystem, development, or other allocation does not authorize minting beyond the one-billion-token maximum.

Taryven may permanently burn legitimately unused TRYV through authorized Treasury or governance action. No burn schedule, guaranteed burn amount, buyback-and-burn program, or guaranteed supply reduction is promised. A burn does not create authority to mint replacement TRYV.

MAXIMUM-SUPPLY ALLOCATION

Every TRYV belongs to a defined category.

Presale & Market Launch	400,000,000	40.0%
Merchant & Customer Rewards	200,000,000	20.0%
Treasury Reserve	125,000,000	12.5%
Ecosystem Growth & Partnerships	100,000,000	10.0%
Founder & Advisory	75,000,000	7.5%
Development & Operations	50,000,000	5.0%
Community & Promotional Programs	30,000,000	3.0%
Merchant Referral Program	20,000,000	2.0%
TOTAL	1,000,000,000	100.0%

The full maximum supply is assigned to defined tokenomics categories. Tokens may remain reserved until earned, vested, distributed, or otherwise released under the applicable program.

Unused or unreleased TRYV does not automatically enter circulation and cannot be reclassified to increase the Founder and Advisory allocation above its 75,000,000 TRYV maximum.

PRESALE & MARKET LAUNCH

400M TRYV maximum category.

1	\$0 - \$500,000	\$0.030
2	\$500,000 - \$1,500,000	\$0.035
3	\$1,500,000 - \$3,000,000	\$0.040

4	\$3,000,000 - \$5,000,000	\$0.045
5	\$5,000,000 - \$7,500,000	\$0.050
6	\$7,500,000 - \$10,000,000	\$0.055

A maximum of 400,000,000 TRYV, representing 40% of maximum supply, is assigned to the combined Presale & Market Launch category.

This does not mean that 400 million TRYV will be sold during the Presale. Purchaser allocations are determined by actual qualifying purchases and the applicable pricing stages.

The \$1.5 million figure is a development and launch milestone. It is not an automatic-refund threshold or guarantee.

A contribution crossing a pricing boundary is allocated using the applicable price within each stage rather than applying a single price to the entire contribution.

At the full \$10 million hard cap, the six-stage pricing schedule allocates approximately 222.637 million TRYV to Presale purchasers. The broader 400 million TRYV category therefore should not be interpreted as a representation that all 400 million TRYV will be sold in the Presale.

PRESALE PURCHASER RELEASE

25% at TGE. 75% released gradually.

TGE is not currently configured. No specific TGE date should be assumed until Taryven formally establishes it.

FOUNDER & ADVISORY

75M TRYV hard maximum.

Lead Founder	1	19,000,000	19,000,000
Founder	4	8,000,000	32,000,000
Advisor	6	4,000,000	24,000,000
TOTAL	11	-	75,000,000

The Lead Founder, all four Founder positions, and all six Advisory positions follow the same core token schedule: a 12-month initial lock followed by 24-month vesting in equal installments every 30 days.

Founder and Advisor allocations have zero automatic TGE circulation. The Lead Founder receives no early-unlock exemption.

Under the current departure policy, vested TRYV remains with the participant. Applicable unvested TRYV is forfeited and returned to the Taryven Treasury when a Founder or Advisor leaves during vesting.

MERCHANT REFERRAL PROGRAM

20M TRYV dedicated referral pool.

Qualified merchant-referral rewards recorded during the Presale use the same release schedule as Presale-purchased TRYV: 25% at TGE, followed by 12 releases of 6.25% of the original reward allocation every 30 days for the remaining 75%.

The planned standard merchant-referral reward is 1,000 TRYV per qualifying verified merchant. At that rate, the dedicated allocation can support up to 20,000 qualifying merchant rewards.

Self-referrals are permitted. A merchant owner or operator may refer and register their own legitimate business and may qualify after completing the applicable onboarding and verification requirements.

Submitting an application alone does not earn a reward. The business must become a qualifying verified merchant. Duplicate applications, wallet changes, or minor variations in business information do not create additional qualifying merchant rewards.

Referral rewards recorded during the Presale are not intended to be transferable or claimable before TGE.

MERCHANT & CUSTOMER REWARDS

200M TRYV reserved for qualifying activity.

The Merchant & Customer Rewards allocation represents 20% of maximum TRYV supply and is reserved for qualifying ecosystem activity.

Initial target rates are up to approximately 1% of qualifying transaction value for customers and up to approximately 0.5% for merchants. These are adjustable program targets, not permanent guaranteed rates.

Reward value is intended to be calculated from qualifying transaction value and converted into TRYV using the applicable approved reward-price methodology at the time of reward.

Ordinary wallet-to-wallet transfers do not automatically earn TRYV. Rewards are intended for legitimate qualifying activity under applicable Taryven Pay program rules.

Reserved reward TRYV enters circulation only when legitimately earned and released. Exhaustion of the rewards pool does not authorize additional minting.

PROJECT-CONTROLLED RESERVES

305M TRYV with zero automatic TGE release.

Treasury Reserve	125,000,000	12.5%	0%
Ecosystem Growth & Partnerships	100,000,000	10.0%	0%
Development & Operations	50,000,000	5.0%	0%
Community & Promotional Programs	30,000,000	3.0%	0%
TOTAL	305,000,000	30.5%	0%

These allocations remain reserved until needed for an authorized and disclosed project purpose. Their existence does not make them circulating supply at TGE.

Potential authorized uses include security, infrastructure, development, independent reviews and audits, merchant adoption, integrations, strategic partnerships, ecosystem expansion, liquidity support, community programs, operational requirements, and other legitimate Taryven purposes.

Treasury Reserve TRYV is not additional Founder or Advisor compensation.

MARKET LAUNCH & LIQUIDITY

Liquidity is planned, not guaranteed.

Taryven currently anticipates pursuing decentralized-exchange liquidity as part of the post-Presale market-launch process.

The current working liquidity reference is approximately \$0.065 per TRYV. This is a planning reference only. It is not a guaranteed launch price, minimum trading price, future market value, or promise that TRYV will trade at or above that level.

Taryven may designate up to approximately 30% of actual Presale proceeds for initial and early-stage liquidity. At the full \$10 million hard cap, that would represent up to approximately \$3 million.

Actual liquidity capital, TRYV quantity, pair configuration, timing, and deployment structure may differ based on actual Presale participation, security considerations, market conditions, and final launch architecture.

LIQUIDITY GOVERNANCE

Multisignature control, not unilateral control.

Taryven-controlled DEX liquidity is intended to be managed through the Taryven Safe or equivalent multisignature Treasury architecture. No individual Founder is intended to have unilateral authority to withdraw Taryven-controlled liquidity.

Taryven currently targets an approximately 12-month initial minimum liquidity restriction or commitment, subject to the final production DEX and liquidity architecture.

Expiration of an initial restriction does not automatically authorize or require liquidity withdrawal. Legitimate migration, security response, rebalancing, or other necessary changes require authorized action under the applicable Treasury controls.

Relevant Taryven-controlled liquidity pool and position information is intended to be publicly identifiable on-chain where technically applicable.

TREASURY GOVERNANCE

Major Treasury authority uses multisignature control.

Taryven's Primary Safe is designed to serve as the principal Treasury authority for major project-controlled assets and production Presale administration.

Purpose-specific operational wallets may be funded from the Primary Safe as needed. Those downstream wallets do not replace the Safe as the principal Treasury control structure.

Significant Treasury, liquidity, and other protected administrative actions are intended to require applicable multisignature authorization rather than unilateral Founder authority.

SECURITY & TRANSPARENCY

Tokenomics should be independently observable.

Taryven intends to publish appropriate production information that allows participants to distinguish maximum supply, defined allocations, vested or released TRYV, and actual circulating supply.

Taryven has conducted an internal engineering security-review program covering Presale-critical and related smart-contract behavior. Internal security review is not an independent third-party audit.

Independent security review of applicable production-critical scope remains a separate project milestone. Neither internal testing nor an independent audit can guarantee that software is free from every vulnerability.

ECONOMIC RISK

No guaranteed return or market outcome.

TRYV is designed and intended to function as a utility token within the Taryven ecosystem. Nothing in this Tokenomics framework represents a promise or guarantee of profit, investment return, token appreciation, market liquidity, future market price, exchange listing, merchant adoption, project revenue, or any particular financial outcome.

Digital assets may experience substantial volatility and may lose some or all economic value. If TRYV becomes publicly tradable, market participants and available liquidity will determine its market price.

Presale pricing, fixed maximum supply, Founder locks, purchaser release schedules, rewards allocations, Treasury controls, and liquidity plans do not guarantee future TRYV market performance.

UNDERSTANDING SUPPLY

Allocation is not circulation.

For example, the existence of a 200,000,000 TRYV Merchant & Customer Rewards allocation does not mean those tokens circulate at TGE. Likewise, the Founder and Advisory allocation has zero automatic TGE circulation because it begins with a 12-month lock.
